### **NAME**

CUTEST\_cshj\_threaded - CUTEst tool to evaluate the Hessian of the John function, in sparse format.

#### **SYNOPSIS**

```
CALL CUTEST cshi threaded (status, n, m, X, y0, Y, nnzh, lh, H val, H row, H col, thread)
```

For real rather than double precision arguments, instead

```
CALL CUTEST_cshj_threaded_s( ... )
```

and for quadruple precision arguments, when available,

CALL CUTEST\_cshj\_threaded\_q( ... )

# **DESCRIPTION**

The CUTEST\_cshj\_threaded subroutine evaluates the Hessian of the John function  $j(x, y0, y) = y0 f(x) + y^T c(x)$  for the problem decoded from a SIF file by the script *sifdecoder* at the point (x, y0, y) = (X, y0, Y). The matrix is stored in sparse format.

The problem under consideration is to minimize or maximize an objective function f(x) over all  $x \in \mathbb{R}^n$  subject to general equations  $c_i(x) = 0$ ,  $(i \in 1, ..., m_E)$ , general inequalities  $c_i^l \le c_i(x) \le c_i^u$ .  $(i \in m_E + 1, ..., m)$ , and simple bounds  $x^l \le x \le x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

## **ARGUMENTS**

The arguments of CUTEST\_cshj\_threaded are as follows

```
status [out] - integer
```

the outputr status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

n [in] - integer

the number of variables for the problem,

m [in] - integer

the total number of general constraints,

X [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

y0 [in] - real/double precision

the John scalar associated with the objective,

Y [in] - real/double precision

an array which gives the John multipliers,

nnzh [out] - integer

the number of nonzeros in H\_val,

**lh** [in] - integer

the actual declared dimensions of H\_val, H\_row and H\_col,

# H\_val [out] - real/double precision

an array which gives the values of the Hessian matrix of the John function evaluated at X, y0 and Y. The i-th entry of H\_val gives the value of the nonzero in row H\_row(i) and column H\_col(i). Only the upper triangular part of the Hessian is stored,

## H\_row [out] - integer

an array which gives the row indices of the nonzeros of the Hessian matrix of the John function evaluated at X, y0 and Y,

#### **H\_col** [out] - integer

an array which gives the column indices of the nonzeros of the Hessian matrix of the John function evaluated at X, y0 and Y,

## thread [in] - integer

thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEST\_csetup\_threaded.
