#### **NAME**

CUTEST\_creport - CUTEst tool to obtain statistics concerning function evaluation and CPU time used.

#### **SYNOPSIS**

```
CALL\ CUTEST\_creport(\ status,\ CALLS,\ TIME\ )
```

For real rather than double precision arguments, instead

```
CALL CUTEST_creport_s( ... )
```

and for quadruple precision arguments, when available,

```
CALL CUTEST_creport_q( ... )
```

## **DESCRIPTION**

The CUTEST\_creport subroutine obtains statistics concerning function evaluation and CPU time used for constrained optimization in a standardized format.

The problem under consideration is to minimize or maximize an objective function f(x) over all  $x \in \mathbb{R}^n$  subject to general equations  $c_i(x) = 0$ ,  $(i \in 1, ..., m_E)$ , general inequalities  $c_i^l \le c_i(x) \le c_i^u$ ,  $(i \in m_E + 1, ..., m)$ , and simple bounds  $x^l \le x \le x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

# **ARGUMENTS**

The arguments of CUTEST\_creport are as follows

```
status [out] - integer
```

the outputr status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

**CALLS** [out] - real array of length 7

gives the number of calls to the problem functions:

CALLS(1): number of calls to the objective function

CALLS(2): number of calls to the objective gradient

CALLS(3): number of calls to the objective Hessian

CALLS(4): number of Hessian times vector products

CALLS(5): number of calls to the constraint functions

CALLS(6): number of calls to the constraint gradients

CALLS(7): number of calls to the constraint Hessians

TIME [out] - real array of length 4:

TIME( 1 ): CPU time (in seconds) for CUTEST\_csetup

- TIME(2): CPU time (in seconds) since the end of CUTEST\_csetup
- TIME(3): elapsed system clock time (in seconds) for CUTEST\_csetup
- TIME(4): elapsed system clock time (in seconds) since the end of CUTEST\_csetup.

## **NOTE**

Note that CALLS(4), CALLS(5) and CALLS(6) may account for codes which allow the evaluation of a selection of constraints only and may thus be much smaller than the number of constraints times the number of iterations.
